

Comment on strategical planning for health medical record gathering and maintenance:

- Fill in the blank. Followed by approximate date
- Check all that apply, Followed by approximate date
- Allow patient to fill out themselves
- Clinical staff could then read back, make legible if needed and add medical terms as required.
- Offer a card with SD chip, their name and insurance numbered stickers as options
- Care facility keeps one, they keep one
- Access by fingerprint to add data

All systems connect through a mainstream, only accessible with the card and fingerprint. Hence, no accidental information added incorrectly to anyone's file.. Confidentiality is vastly increased.

Problem, no phone option for medical records request, but would you need one?

Patricia R. Jones

Suffered numerous life changing harmful results due to incorrect medical information on my record.
